- Notes:
1. Above loads include the weight of the member. This must be deducted to arrive at the net allowable load the beam will support.
 2. Long span beams should be supported in such a manner as to prevent rotation and twist.
 3. Allowable uniformly distributed loads are listed for various simple spans, that is, a beam on two supports. If load is concentrated at the center of the span, multiply load from the table by 0.5 and corresponding deflection by 0.8.

Wt/100 Ft: 223 Lbs (331 kg/100 m)
Allowable Moment 7,480 In-Lbs (850 N•m)
12 Gauge Nominal Thickness .105" (2.7mm)
